IN THE CLAIMS

The listing of claims will replace all prior versions, and listings, of claims in

the application:

Listing of Claims:

1. (Original) An apparatus comprising:

a plurality of source followers, each of the plurality of source followers

comprising a pull-down transistor having a source, a drain, a gate, and a bulk

terminal; and

a plurality of pull-up transistors, each of the plurality of pull-up transistors

having a source, a drain, and a gate, wherein the drain of each of the plurality of

pull-up transistors is coupled to the source of a pull-down transistor of the plurality

of source followers, to output a plurality of differential signals via the drains of the

plurality of pull-up transistors.

2. (Original) The apparatus of claim 1, wherein the bulk terminal of the pull-

down transistor is coupled to the source of the pull-down transistor.

3. (Original) The apparatus of claim 2, wherein the pull-down transistor is a p-

channel transistor.

Inventor(s): Reinschmidt

Application No.: 10/815,057

Cypress Ref. No.: CD03028

Examiner: Tan, Vibol

Art Unit: 2819 BSTZ Ref. No.: 016820.P281 4. (Original) The apparatus of claim 1, further comprising:

a first current source coupled to the sources of the plurality of pull-up

transistors;

an operational amplifier, coupled to the first current source, to drive the first

current source; and

a feedback path coupled between the drains of the plurality of pull-up

transistors and an input of the operational amplifier.

5. (Original) The apparatus of claim 4, wherein the feedback path further

comprises a sensing circuit, the sensing circuit includes a plurality of transistors

biased by a predetermined voltage.

6. (Original) The apparatus of claim 4, wherein the first current source is

powered by a first voltage of at least about 1.624V to 2.725V.

7. (Original) The apparatus of claim 1, further comprising a low swing

differential pre-driver, coupled to the gates of the pull-down transistors of the

plurality of source followers, to drive the pull-down transistors.

8. (Original) The apparatus of claim 7, wherein the low swing differential pre-

-3/12-

driver comprises:

a second current source;

Examiner: Tan, Vibol Art Unit: 2819

a current sink including a transistor and a resistor, the transistor being

coupled to the resistor in parallel; and

a load, coupled between the second current source and the current sink, to

output a plurality of low swing differential signals, wherein each of the plurality of

low swing differential signals drives the gate of the pull-down transistor of one of

the plurality of source followers.

9. (Original) The apparatus of claim 1, further comprising a plurality of

inverters, each of the plurality of inverters being coupled to the gate of each of the

plurality of pull-up transistors to amplify an input signal and to apply the amplified

signal to the gate of the corresponding pull-up transistor, wherein the plurality of

inverters are powered by a second voltage approximately between 1.1V and 1.3V.

10. (Original) The apparatus of claim 1, further comprising:

a network interface including the plurality of pull-up transistors and the

plurality of source followers; and

a plurality of transmission lines coupled to the network interface, the

plurality of transmission lines being driven by the plurality of low voltage

differential signals.

11. (Original) The apparatus of claim 10, further comprising a network

component coupled to the network interface via the plurality of transmission lines,

Inventor(s): Reinschmidt

Application No.: 10/815,057

Cypress Ref. No.: CD03028

Examiner: Tan, Vibol
- 4/12- Art Unit: 2819

wherein the network component includes a storage device.

12. (Currently amended) A method comprising:

providing a plurality of input signals to a plurality of pull-up transistors;

coupling each of the plurality of pull-up transistors to one of a plurality of

pull-down transistors; and

driving the plurality of pull-down transistors with a plurality of differential

low swing signals to output a plurality of low voltage differential signals in response

to the plurality of input signals; and

generating the plurality of differential low swing signals using a low swing

differential pre-driver.

13. (Currently amended) The method of claim 12, wherein each of the plurality

of pull-down transistors has a source, a drain, a gate, and a bulk terminal, the bulk

terminal of each of the plurality of pull-down transistors is coupled to the source of

the corresponding pull-down transistor to reduce further comprising reducing body

effect on the corresponding plurality of pull-down transistors.

14. (Currently amended) The A method of claim 12, further comprising:

providing a plurality of input signals to a plurality of pull-up transistors;

coupling each of the plurality of pull-up transistors to one of a plurality of

pull-down transistors;

Inventor(s): Reinschmidt

Application No.: 10/815,057

Cypress Ref. No.: CD03028

Examiner: Tan, Vibol Art Unit: 2819

BSTZ Ref. No.: 016820.P281

-5/12-

driving the plurality of pull-down transistors with a plurality of differential

low swing signals to output a plurality of low voltage differential signals in

response to the plurality of input signals;

supplying current to the plurality of pull-up transistors from a first current

source;

sensing one of the plurality of low voltage differential signals to produce a

feedback signal; and

driving the first current source with an operational amplifier in response to

the feedback signal.

15. Canceled.

16. (Currently amended) The method of claim 1512, wherein generating the

plurality of differential low swing signals using the low swing differential pre-driver

comprises:

supplying current to a load from a second current source;

sinking the current from the load via a transistor and a resistor, the transistor

being coupled to the resistor in parallel; and

outputting a plurality of low swing differential signals via the load to the

gates of the plurality of pull-down transistors.

17. (Currently amended) The A method of claim 12, further comprising

-6/12-

Inventor(s): Reinschmidt

Application No.: 10/815,057

Cypress Ref. No.: CD03028

Examiner: Tan, Vibol

Art Unit: 2819

providing a plurality of input signals to a plurality of pull-up transistors;

coupling each of the plurality of pull-up transistors to one of a plurality of

pull-down transistors;

driving the plurality of pull-down transistors with a plurality of differential

low swing signals to output a plurality of low voltage differential signals in

response to the plurality of input signals; and

amplifying the plurality of input voltages using a plurality of inverters, each

of the plurality of inverters being coupled to a distinct one of the plurality of pull-up

transistors.

18. (Currently amended) An apparatus comprising:

means for providing a plurality of input signals to a plurality of pull-up

transistors;

means for coupling each of the plurality of pull-up transistors to one of a

plurality of pull-down transistors; and

means for driving the plurality of pull-down transistors with a plurality of

differential low swing signals to output a plurality of low voltage differential signals

in response to the plurality of input signals.-;

means for providing current to the plurality of pull-up transistors;

means for sensing one of the plurality of low voltage differential signals to

produce a feedback signal; and

means for adjusting the current in response to the feedback signal.
